

Assignment 1

Done by: Moldir Polat

Exercise 1: Kotlin Syntax Basics

1. Variables and Data Types:

In this image I created variables of different types(integer, double, string, boolean) and printed them in the console.

The screenshot displays the Android Studio IDE. The top pane shows the code for MainActivity.kt, and the bottom pane shows the console output.

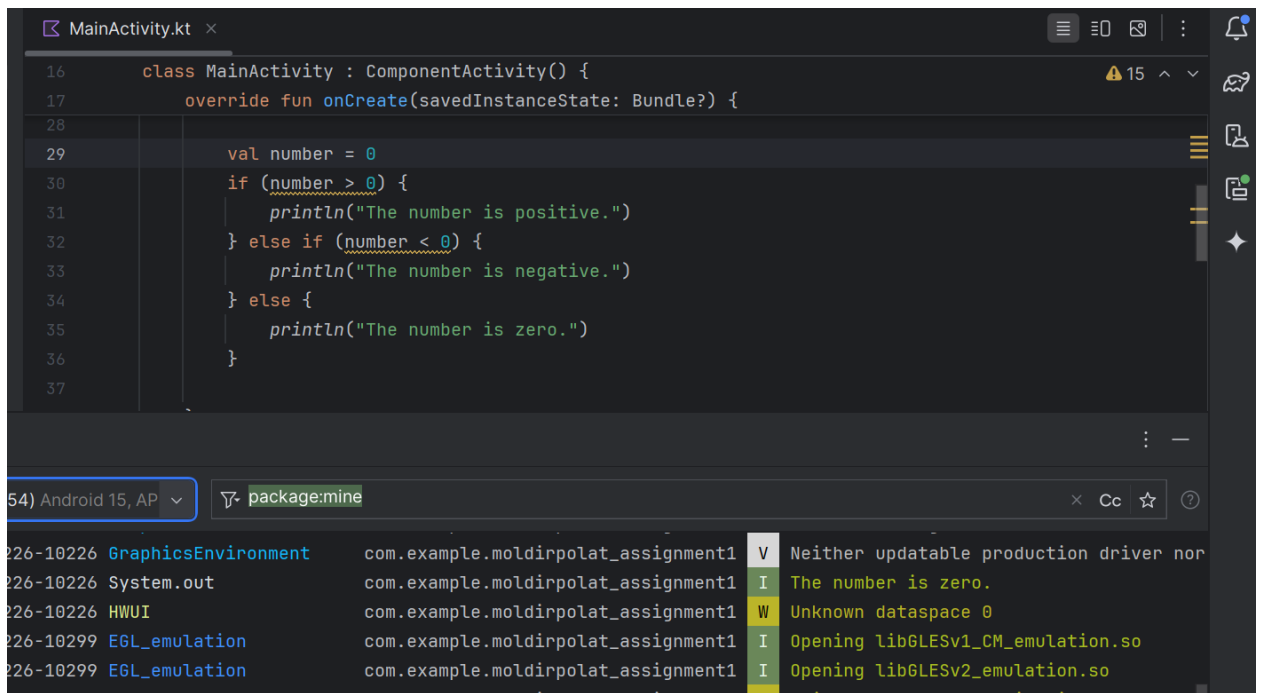

```
15
16 <> class MainActivity : AppCompatActivity() {
17   @Override fun onCreate(savedInstanceState: Bundle?) {
18     super.onCreate(savedInstanceState)
19     val myInt: Int = 8
20     val myDouble: Double = 8.5
21     val myString: String = "This is exercise 1"
22     val myBoolean: Boolean = true
23
24     println("Integer: $myInt")
25     println("Double: $myDouble")
26     println("String: $myString")
27     println("Boolean: $myBoolean")
28   }
}
```

The console output shows the following lines:

```
6-8446 GraphicsEnvironment com.example.moldirpolat_assignment1 V Neither updatable production driver nor
6-8446 System.out com.example.moldirpolat_assignment1 I Integer: 8
6-8446 System.out com.example.moldirpolat_assignment1 I Double: 8.5
6-8446 System.out com.example.moldirpolat_assignment1 I String: This is exercise 1
6-8446 System.out com.example.moldirpolat_assignment1 I Boolean: true
```

Conditional Statements:

In this image I demonstrated the usage of conditional statement IF, it checks whether the NUMBER is positive or negative or zero.

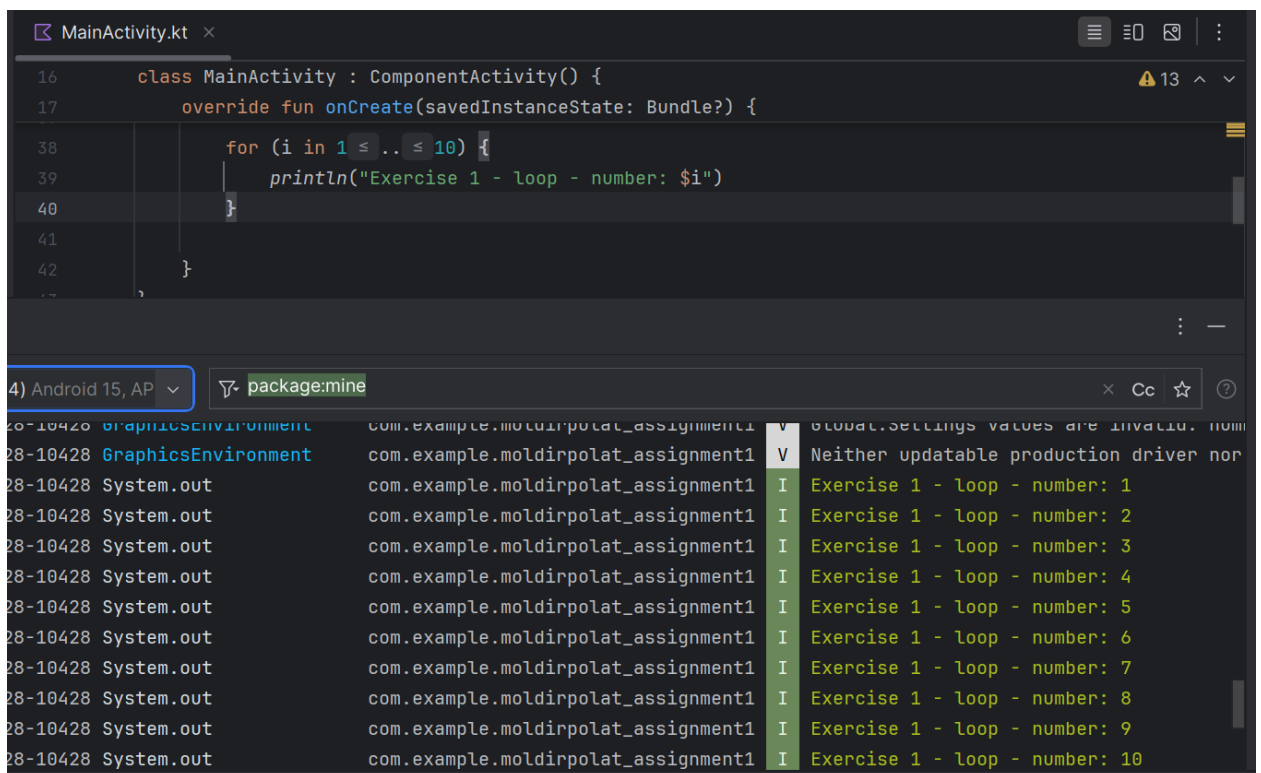

```
16 class MainActivity : AppCompatActivity() {
17     override fun onCreate(savedInstanceState: Bundle?) {
28
29         val number = 0
30         if (number > 0) {
31             println("The number is positive.")
32         } else if (number < 0) {
33             println("The number is negative.")
34         } else {
35             println("The number is zero.")
36         }
37     }
}
```

Logcat output:

Time	Tag	Level	Message
226-10226	GraphicsEnvironment	V	Neither updatable production driver nor
226-10226	System.out	I	The number is zero.
226-10226	HWUI	W	Unknown dataspace 0
226-10299	EGL_emulation	I	Opening libGLESv1_CM_emulation.so
226-10299	EGL_emulation	I	Opening libGLESv2_emulation.so

Loops:

In this image I showed the loop FOR usage printing all numbers from 1 to 10.

```
16 class MainActivity : AppCompatActivity() {
17     override fun onCreate(savedInstanceState: Bundle?) {
38         for (i in 1..10) {
39             println("Exercise 1 - loop - number: $i")
40         }
41     }
42 }
}
```

Logcat output:

Time	Tag	Level	Message
28-10428	GraphicsEnvironment	V	Global settings values are invalid. num
28-10428	GraphicsEnvironment	V	Neither updatable production driver nor
28-10428	System.out	I	Exercise 1 - loop - number: 1
28-10428	System.out	I	Exercise 1 - loop - number: 2
28-10428	System.out	I	Exercise 1 - loop - number: 3
28-10428	System.out	I	Exercise 1 - loop - number: 4
28-10428	System.out	I	Exercise 1 - loop - number: 5
28-10428	System.out	I	Exercise 1 - loop - number: 6
28-10428	System.out	I	Exercise 1 - loop - number: 7
28-10428	System.out	I	Exercise 1 - loop - number: 8
28-10428	System.out	I	Exercise 1 - loop - number: 9
28-10428	System.out	I	Exercise 1 - loop - number: 10

Here I wrote the example of WHILE loop, also printing numbers from 1 to 10.

The screenshot shows the MainActivity.kt file with the following code:

```

16 class MainActivity : ComponentActivity() {
17     override fun onCreate(savedInstanceState: Bundle?) {
41         var i = 1
42         while (i <= 10) {
43             println("Exercise 1 - while -number: $i")
44             i++
45         }
46     }

```

The Logcat window shows the output of the while loop, displaying "Exercise 1 - while -number: 1" through "Exercise 1 - while -number: 10".

Collections:

Here I created the list, found the SUM of all numbers of that list, for which I used for loop iteration.

The screenshot shows the MainActivity.kt file with the following code:

```

16 class MainActivity : ComponentActivity() {
17     override fun onCreate(savedInstanceState: Bundle?) {
46         val numbers = listOf(1, 2, 3, 4, 5, 6, 7, 8)
47         var sum = 0
48         for (num in numbers) {
49             sum += num
50         }
51         println("the sum of all numbers from 1 to 8: $sum")
52     }
53 }
54
55
56 @Composable

```

The Logcat window shows the output of the for loop, displaying "the sum of all numbers from 1 to 8: 36".

Exercise 2: Kotlin OOP (Object-Oriented Programming)

1. Create a **Person** class:

I created Person class with name, age, and email. It has method to display the person's details.

```
MainActivity.kt x
40 class Person(
41     val name: String,
42     val age: Int,
43     val email: String
44 ) {
45     // Method to display the person's details
46     open fun displayInfo() {
47         println("Name: $name")
48         println("Age: $age")
49         println("Email: $email")
50     }
51 }
```

or-5554) Android 15, AP v package:mine

```
com...le.moldirpolat_assign1_exerc2 V angle_gl_driver_selection_values=[]
com...le.moldirpolat_assign1_exerc2 V Global.Settings values are invalid: number of packages: 0, number of va
com...le.moldirpolat_assign1_exerc2 V Neither updatable production driver nor prerelease driver is supported.
com...le.moldirpolat_assign1_exerc2 I Name: Moldir Polat
com...le.moldirpolat_assign1_exerc2 I Age: 24
com...le.moldirpolat_assign1_exerc2 I Email: m_polat@kbtu.kz
```

Inheritance:

I created Employee class which inherits all properties and methods from parent Person class, and there is additional property SALARY. Method displayInfo is overridden: we call parent classes' method and print salary at the end.

```
MainActivity.kt x
54
55 class Employee(
56     name: String,
57     age: Int,
58     email: String,
59     val salary: Double
60 ) : Person(name, age, email) {
61
62
63     override fun displayInfo() {
64         super.displayInfo()
65         println("Salary: $salary")
66     }
67 }
```

ator-5554) Android 15, AP v package:mine

```
com...le.moldirpolat_assign1_exerc2 V Global.Settings values are invalid: number of packages: 0, number of values
com...le.moldirpolat_assign1_exerc2 V Neither updatable production driver nor prerelease driver is supported.
com...le.moldirpolat_assign1_exerc2 I Name: Moldir Polat
com...le.moldirpolat_assign1_exerc2 I Age: 24
com...le.moldirpolat_assign1_exerc2 I Email: m_polat@kbtu.kz
com...le.moldirpolat_assign1_exerc2 I Salary: 300000.0
com...le.moldirpolat_assign1_exerc2 W Unknown dataspace 0
```

Encapsulation:

In this exercise I created BankAccount class with private property and controlled access methods deposit() and withdraw().

```
MainActivity.kt x
79 }
80 class BankAccount(
81     private var balance: Double = 0.0
82 ) {
83     fun deposit(amount: Double) {
84         if (amount > 0) {
85             balance += amount
86             println("Dear user, you deposited: $amount tenge")
87         } else {
88             println("Dear user, deposit amount cannot be negative")
89         }
90     }
91
92     fun withdraw(amount: Double) {
93         if (amount > 0 && amount <= balance) {
94             balance -= amount
95             println("Dear, user, you withdrew: $amount tenge")
96         } else if (amount > balance) {
97             println("Dear user, your balance is insufficient")
98         } else {
99             println("Dear user, withdrawal amount cannot be negative")
100         }
101     }
102 }
```

ava > com > example > moldirpolat_assign1_exerc2 > MainActivity.kt > MainActivity > onCreate 33:35 LF UTF-8 4 spaces

Here I wrote the usage of previous class BankAccount.

```
MainActivity.kt x
16 class MainActivity : ComponentActivity() {
17     override fun onCreate(savedInstanceState: Bundle?) {
24         val account = BankAccount( balance: 200000.0)
25         account.displayBalance()
26
27         account.deposit( amount: 50000.0)
28         account.displayBalance()
29
30         account.withdraw( amount: 40000.0)
31         account.displayBalance()
32
33         account.withdraw( amount: 300000.0)
34         account.displayBalance()
35     }
36 }
```

Android Studio interface showing the log output:

```
com...le.moldirpolat_assign1_exerc2 I Your balance is: 200000.0 tenge
com...le.moldirpolat_assign1_exerc2 I Dear user, you deposited: 50000.0 tenge
com...le.moldirpolat_assign1_exerc2 I Your balance is: 250000.0 tenge
com...le.moldirpolat_assign1_exerc2 I Dear, user, you withdrew: 40000.0 tenge
com...le.moldirpolat_assign1_exerc2 I Your balance is: 210000.0 tenge
com...le.moldirpolat_assign1_exerc2 I Dear user, your balance is insufficient
com...le.moldirpolat_assign1_exerc2 I Your balance is: 210000.0 tenge
```

Exercise 3: Kotlin Functions

1. Basic Function:

This function takes two integers as arguments and returns their sum.

```
Version control ▾ Medium Phone ... ▾ app ▾
```

```
MainActivity.kt x
```

```
34 fun GreetingPreview() {
38 }
39
40 fun sum(a: Int, b: Int): Int {
41     return a + b
42 }
43
```

ator-5554) Android 15, AP ▾ package:mine

```
com.example.moldirpolat_exercise3 V angle_gl_driver_selection_pkgs=
com.example.moldirpolat_exercise3 V angle_gl_driver_selection_values=
com.example.moldirpolat_exercise3 V Global.Settings values are invalid:
com.example.moldirpolat_exercise3 V Neither updatable production driver
com.example.moldirpolat_exercise3 I Sum: 130
com.example.moldirpolat_exercise3 W Unknown dataspace 0
com.example.moldirpolat_exercise3 I Opening libGLESv1_CM_emulation.so
com.example.moldirpolat_exercise3 I Opening libGLESv2_emulation.so
```

Usage example of SUM basic function.

```
MainActivity.kt x
```

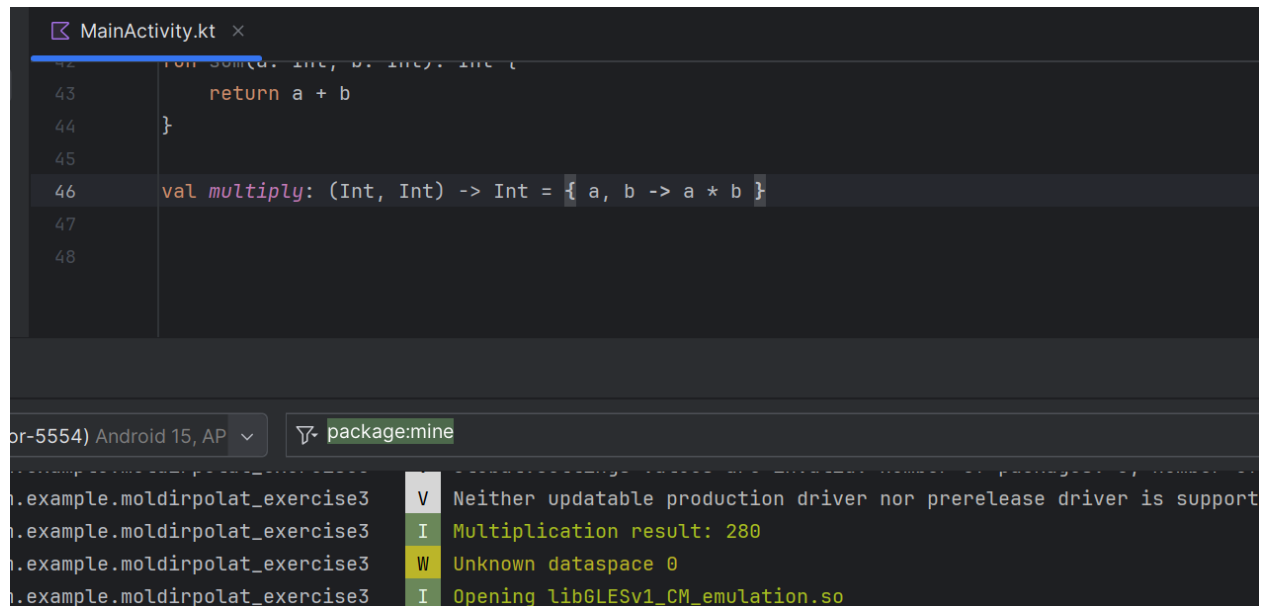

```
1 package com.example.moldirpolat_exercise3
2
3 > import ...
15
16 class MainActivity : AppCompatActivity() {
17     override fun onCreate(savedInstanceState: Bundle?) {
18         super.onCreate(savedInstanceState)
19         val result = sum(a: 58, b: 72)
20         println("Sum: $result")
21     }
22 }
23
```

-5554) Android 15, AP ▾ package:mine

```
com.example.moldirpolat_exercise3 V Neither updatable production driver nor prerelease driver is supported.
com.example.moldirpolat_exercise3 I Sum: 130
```

Lambda Functions:

There is a lambda function that multiplies two numbers and returns the result.

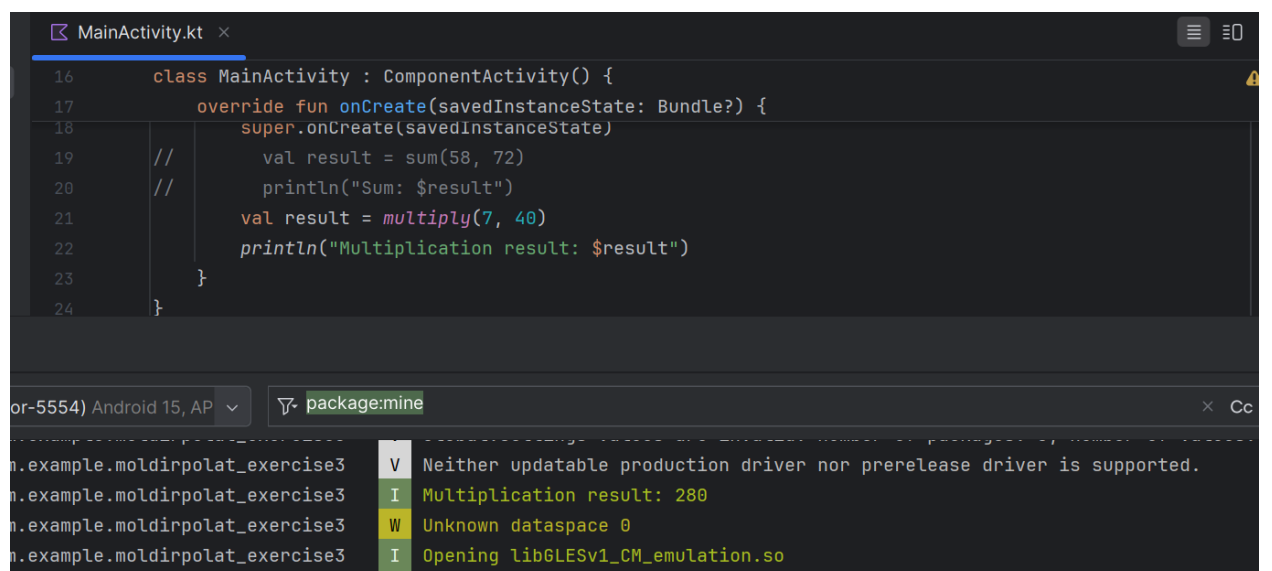

```
MainActivity.kt
42 fun sum(a: Int, b: Int): Int {
43     return a + b
44 }
45
46 val multiply: (Int, Int) -> Int = { a, b -> a * b }
47
48
```

Log output:

- V Neither updatable production driver nor prerelease driver is support
- I Multiplication result: 280
- W Unknown dataspace 0
- I Opening libGLESv1_CM_emulation.so

Usage of LAMBDA function:

```
MainActivity.kt
16 class MainActivity : AppCompatActivity() {
17     override fun onCreate(savedInstanceState: Bundle?) {
18         super.onCreate(savedInstanceState)
19         // val result = sum(58, 72)
20         // println("Sum: $result")
21         val result = multiply(7, 40)
22         println("Multiplication result: $result")
23     }
24 }
```

Log output:

- V Neither updatable production driver nor prerelease driver is supported.
- I Multiplication result: 280
- W Unknown dataspace 0
- I Opening libGLESv1_CM_emulation.so

Higher-Order Functions:

Higher-order function here takes a lambda function as a parameter and applies it to two integers.

```
MainActivity.kt x
59 val multiply: (Int, Int) -> Int = { a, b -> a * b }
60
61
62 fun executeFunction(a: Int, b: Int, function: (Int, Int) -> Int): Int {
63     return function(a, b)
64 }
65
66
```

-5554) Android 15, AP v package:mine

```
com.example.moldirpolat_exercise3 V angle_gl_driver_selection_values=[]
com.example.moldirpolat_exercise3 V Global.Settings values are invalid: number of packages: 0, number of values: 0
com.example.moldirpolat_exercise3 V Neither updatable production driver nor prerelease driver is supported.
com.example.moldirpolat_exercise3 I Result of function: 60
com.example.moldirpolat_exercise3 I Sum is: 70
```

Usage of higher-order function(using lambda function and inline lambda directly)

```
MainActivity.kt x
16 class MainActivity : AppCompatActivity() {
17     override fun onCreate(savedInstanceState: Bundle?) {
25
26         val result = executeFunction(a: 6, b: 10, multiply) //using lambda function
27         println("Result of function: $result")
28
29
30         val sumResult = executeFunction(a: 20, b: 50) { x, y -> x + y } //using inline lambda directly
31         println("Sum is: $sumResult")
32
33
```

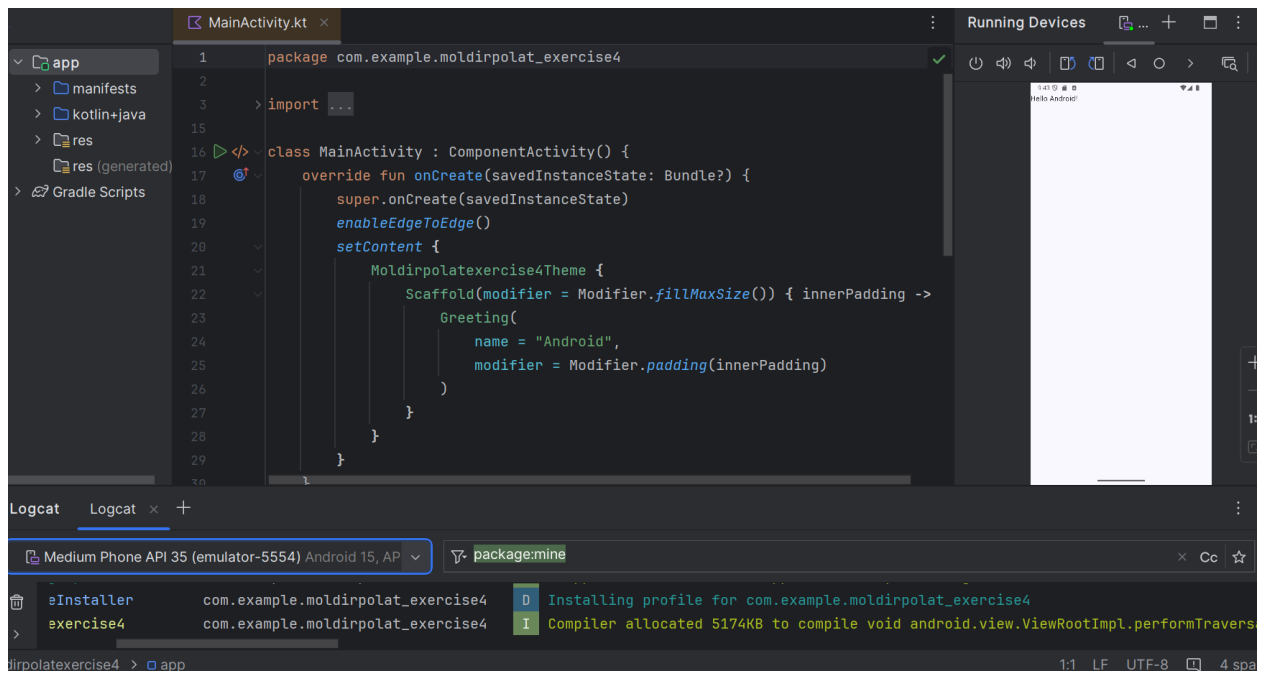

-5554) Android 15, AP v package:mine

```
com.example.moldirpolat_exercise3 V angle_gl_driver_selection_values=[]
com.example.moldirpolat_exercise3 V Global.Settings values are invalid: number of packages: 0, number of values: 0
com.example.moldirpolat_exercise3 V Neither updatable production driver nor prerelease driver is supported.
com.example.moldirpolat_exercise3 I Result of function: 60
com.example.moldirpolat_exercise3 I Sum is: 70
```

Exercise 4: Android Layout in Kotlin (Instagram-like Layout)

1. Set Up the Android Project:

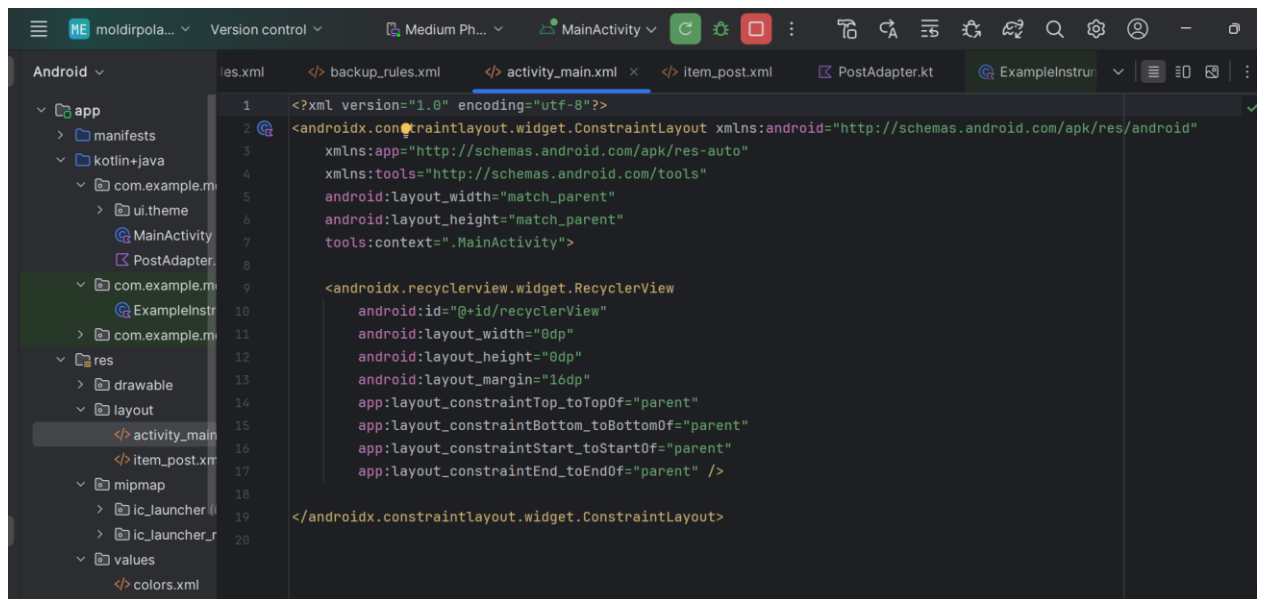

At first I created Android Kotlin-based project empty and it prints: Hello, Docker!

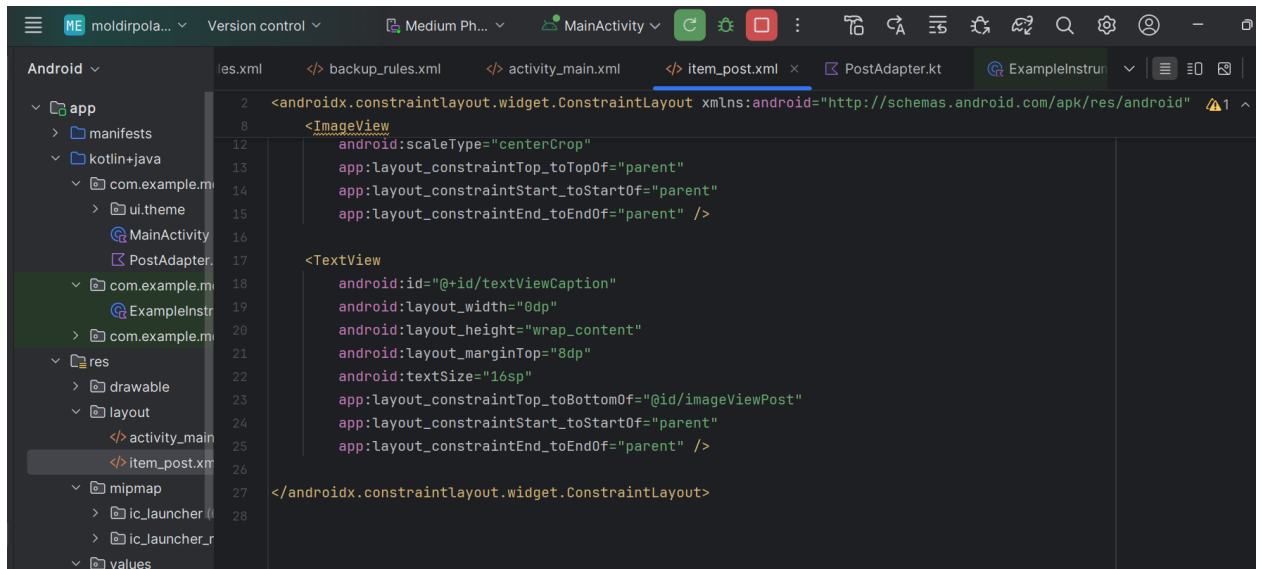

2. Design the Layout:

activity_main.xml

I added a RecyclerView for the feed, where each item will contain an ImageView for the post image and a TextView for the caption.

Then created new XML layout for individual post in the feed. It defines how each post will look like (image+caption).

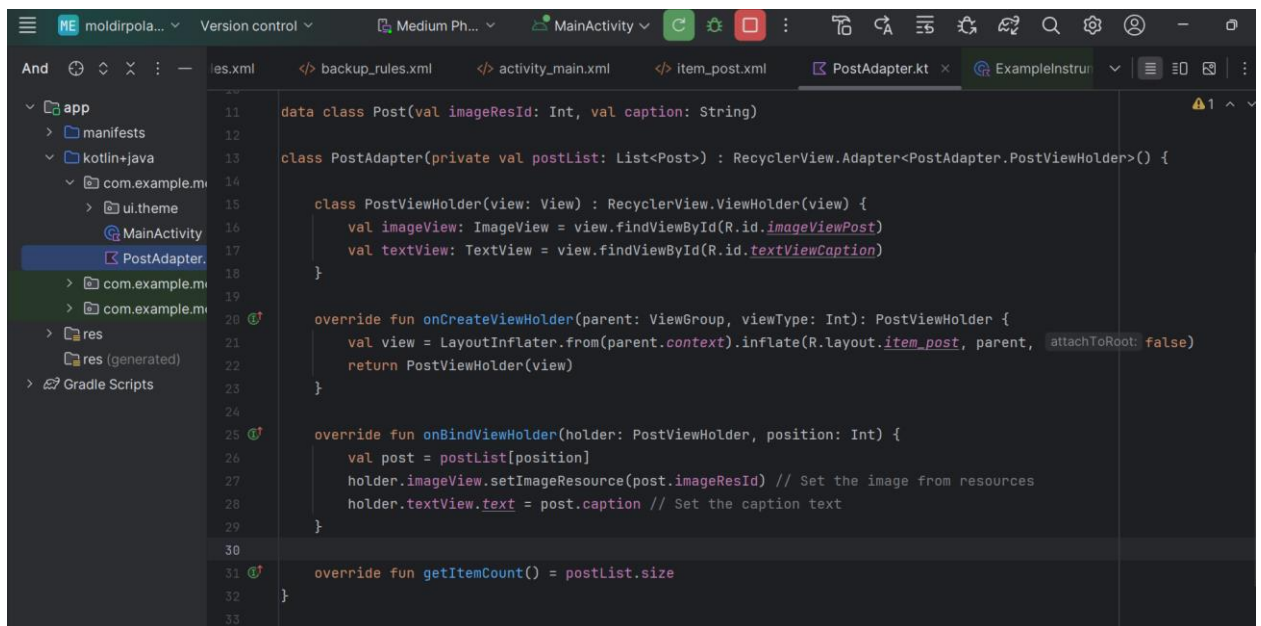

Create the RecyclerView Adapter:

Now I need an adapter to bind data to the RecyclerView – PostAdapter.kt class file.

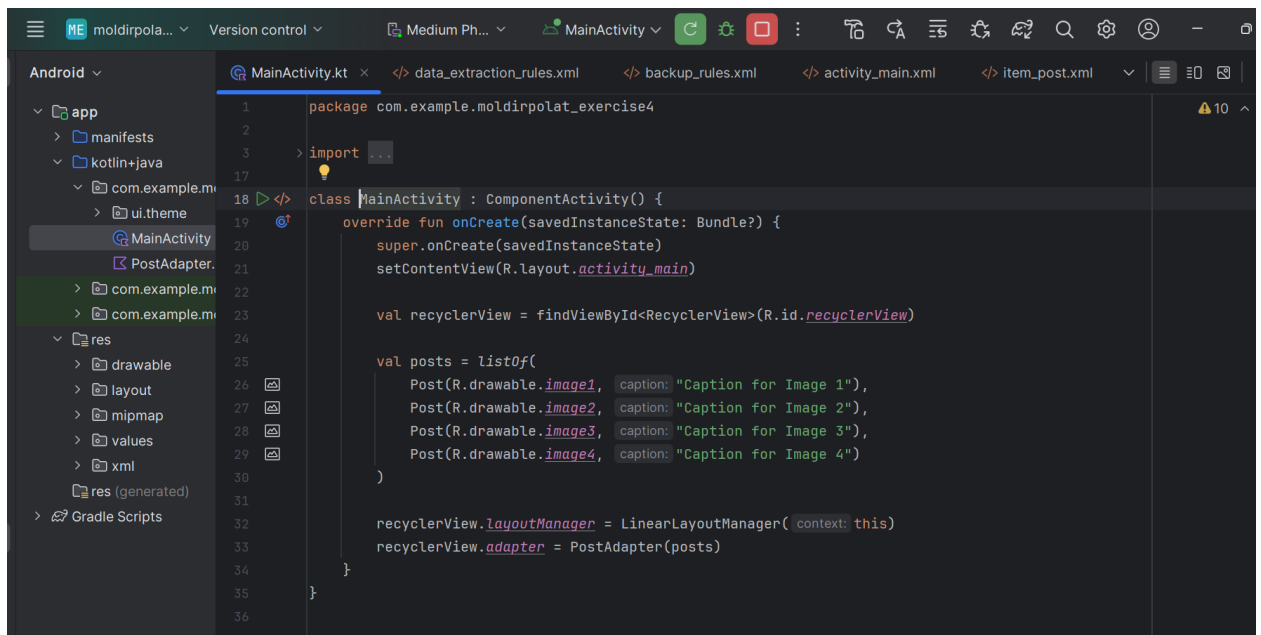

Post class - a simple data class that holds the image ID and caption.

PostAdapter - a RecyclerView.Adapter that binds the data to the views in item_post.xml.

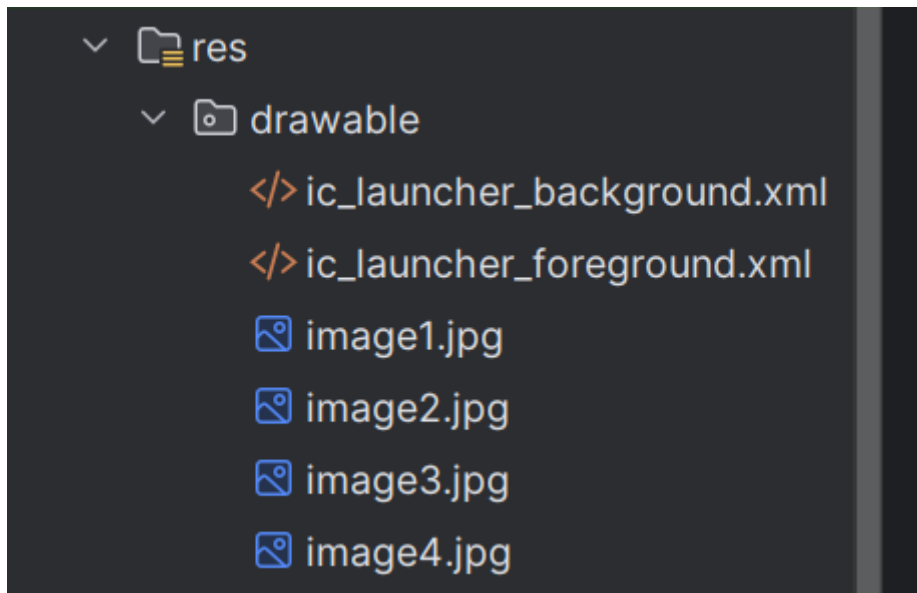

MainActivity Setup:

In MainActivity.kt file I initialize the RecyclerView and populate it with some sample data.

res/drawable has some images.

The final result:
